Hydraulic Seal and Oil Seal Catalog

Our Policy

Prices

Prices quoted are for acceptance within thirty days from date quoted. Unless specified, prices are based on our receiving order for quantities quoted.

Terms

Our terms of payment are 1% 10, net 30 days, unless other arrangements are made through our credit department.

Minimum Invoice

Orders consisting of O-Rings Only - \$5.00

Orders consisting of O-Rings and/or All Other Products (Excluding Plastic Products) - \$15.00

City Sales Counter - \$35.00

Plastic Products - \$50.00

Warranty

Products are warranted against defects in workmanship and defects in material. Products having such defects will be replaced or credited as APG elects. Liability is limited to the invoice value of the defective item. Our responsibility shall not exceed the original purchase price of the defective product. In any event, APG shall not be held responsible for any special or consequential damages. In all cases, please contact us for approval and routing of return items. All claims of shortage or damage must be made within 30 days after receipt of shipment.

Freight

All orders totaling less than \$1500 at NET prices are F.O.B. our warehouse with no freight allowance. Orders totaling \$1500 or more at NET prices, any product mix, receive full freight prepaid and allowed, provided such orders are for one shipment within the lower 48 continental United States and provided our normal freight modes are used. Special delivery charges incurred at the customer's request are for the customer's account. Exceptions to this freight prepaid and allowed policy: all glass products. These products are F.O.B. our warehouse with no freight allowance unless other items on the order total \$1500 or more at NET prices.

Catalog Information

Various information sources were used to compile this catalog. We offer this information only as a guide and cannot assume responsibility for accuracy of the data herein. Prices listed are current, subject to change.

The Complete APG Product Line is Listed on Pages 88 and 89

Loaded Lip Seals

Loaded Lip Seals are very versatile and can be used as rod seals or piston seals. They are considered to be multi-purpose seals and are designed for significantly improved performance. APG Loaded Lip Seals are molded from 92 Durometer Urethane with a 70 Durometer Nitrile energizer. The energizer ensures constant pressure on the sealing lips.

Temperature: -65° to +300°F
Pressure: 0 to 5000 psi
Fluids: Petroleum based Hydraulic Fluids

Standard

The Standard Loaded Lip Seal is the most widely used design of Loaded Lip Seal. By energizing the sealing lips with an endless O-ring, you are assured of uniform, positive lip contact and excellent low-pressure sealing. The seal depth is equal to the radial width, which results in a square design. Standard Loaded Lip Seals can be widely used to interchange with existing hydraulic packing and/or O-rings without changing dimensions.

Type "B"

The Loaded Lip Seal Type "B" features a back-beveled sealing lip. This provides greater film breaking and increased unit loading at the sealing surface. The seal depth is generally 1 1/2 times the radial width to ensure seal stability in the most rugged applications. It is most commonly used as a rod seal.

Deep Style

The Loaded Lip Seal – Deep Style incorporates the same unique design as the Standard Loaded Lip Seal, plus its depth is 1 1/2 times greater than the radial width. This increases seal stability to withstand rugged, high shock, heavy-duty applications. This seal will replace many kinds of Vee Packing. When minimum drag is needed, use Standard Loaded Lip Seals or Loaded Lip Seals – Deep Style.

L9011 (Metric)

The L9011 Loaded Lip Seal incorporates the same unique design as the Type "B". The energizer, however, is a Q-Ring instead of an O-Ring.

U-Cups

U-Cups derive their name from their shape and are self-sealing on both the inside diameter and outside diameter. They are most often used for sealing rams or rods and are very popular due to the small gland space required. They are especially adapted to low speed, low pressure environments for both pneumatic and hydraulic cylinders. They provide an extremely smooth, steady movement because of their inherent low friction.

The seal is obtained by means of the flared, flexible lips coming in contact with the rod or cylinder wall. Clearance is provided at the heel for minimum friction. Through this design, the packing is *preloaded* when installed. Sealing effectiveness is increased by internal pressure of the air or fluid against the inner surface of the lips. For continued sealing effectiveness and long seal life, the surface finish of the working surface of either rods or bores should be a maximum of 16 micro-inches. It is not recommended that U-cups or any other single lip seal be used in any application where there is excessive side loading.

8400 Series

The 8400 Series U-Cup has a chamfered lip and is available at APG in 80 Durometer Nitrile.

6226 Series

The 6226 Series U-Cup has a flat sealing lip and is available at APG in 70 Durometer Nitrile.

L9000 Series (Metric)

The Metric L9000 Series U-Cup has a chamfered lip and is available at APG in 94 Durometer Urethane. The symmetrical section allows the L9000 U-Cup to be employed as a rod or piston seal.

In addition to the products in this catalog, APG supplies o-rings, industrial hose couplings, industrial glass, and much, much more! See pages 88 and 89.

U-Cup Installation Data

The lips of the U-Cup should always be toward the pressure force.

The U-Cup is a floating seal which means the height of the U-Cup should be between .015" to .090" shorter than the depth of the gland. (See the Packing Space Chart below). The added gland space allows the pressure to equalize on both lips, thus keeping the U-Cup from rolling.

The surface finish for a static seal surface should be 32 RMS maximum. The dynamic surface should be in the range of 8 to 16 RMS. Finishes rougher than 16 RMS could cause premature lip wear and finishes finer than 8 RMS can result in failure of the seal due to loss of lubrication.

For availability of sizes not listed, please inquire.

Rod Wipers

The main function of the Rod Wiper is to keep the rod and cylinder clean and free from foreign matter; thus preventing premature failure. The Rod Wiper is not a pressure sealing element, yet it avoids possible abrasive effects which may result if contaminants were to reach the sealing and rod bearing elements.

Style WD (RWD)

One-piece snap-in type rod wiper scrapers for heavy duty applications. WD (RWD) wipers are continuous (not split) and conform with wear and side motion for effective wiping action over the entire life span of the seal. APG stocks WD (RWD) Rod Wipers in 90 Durometer Urethane and in 90 Durometer Fluoroelastomer.

Note: APG Stocks a number of sizes with a Slotted Heel Design (SH) in urethane. This design prevents extrusion of snap-in wipers caused by pressure build-up due to excessive rod seal leakage. (See note regarding Slotted Heel Part Numbers below WD (RWD) Dimensional Data Table).

Groove Dimensions meet ANS/B93.35 1978 specifications. (NFPA-T3-197.3R1).

Just ask. We can help!

** Not currently an APG stock item. Call for availability.

Note: A part that is also available in a Slotted Heel Design will have an "SH" suffix in the part number. Refer to current APG price lists.

Style WAN Rod Wipers

Designed for light duty applications where style WD wipers are not required. Interchangeable with corresponding dash numbers of MS28776 wiper rings. Consult APG for AN6231 retrofit. APG stocks WAN Rod Wipers in 90 Durometer Urethane and in 90 Durometer Fluoroelastomer.

Note: APG Stocks a number of sizes with a Slotted Heel Design (SH) in urethane. This design prevents extrusion of snap-in wipers caused by pressure build-up due to excessive rod seal leakage. (See note regarding Slotted Heel Part Numbers below WAN Dimensional Data Table).

Groove Dimensions meet ANS/B93.35 1978 specifications. (NFPA-T3-197.3R1).

Style WH Rod Wipers

Designed for medium duty applications and can provide both wiping and sealing action in one component in low pressure systems. The external lip scrapes foreign matters from the rod, and the other lips act as an effective pressure seal in low pressure applications. This wiper can also be used as a secondary seal to trap slight leakage from the primary seal. This creates a very dry rod system. APG stocks WH Rod Wipers in 90 Durometer Urethane, 90 Durometer Fluoroelastomer and 90 Durometer Nitrile. In Fluoroelastomer and Nitrile, the WH Rod Wiper is also known as Series 8600.

Style WK Rod Wipers

Double lip design provides the ultimate in wiper action to remove foreign material from the exposed rod while still maintaining an adequate lubricating film. It protects both the rod and the primary seal. Molded in 90 Durometer Urethane for maximum strength abrasion resistance.

Metric Wipers

Style M

Incorporates an external metal case with an 80 Durometer Nitrile lip. Designed for press-in fitting in open housings.

Style P6

One piece snap-in wiper for heavy duty applications. Metric equivalent to the WD Style (inch dimensions). Available in 80 Durometer Urethane, 92 Durometer Urethane, and 85 Durometer Fluoroelastomer. At time of publication of this catalog, Style P6 Wipers were not stock items at APG. Please inquire regarding current availability.

Style P7

Incorporates a metal insert for reinforcement. Capable of bridging a large tolerance and cannot seize due to rust. Available in 80 Durometer Nitrile.

Style P8

Similar to the P6 Style but has a step profile that provides an excellent interference fit in its groove and provides the wiper lip additional support. APG stocks the P8 Style in 80 Durometer Nitrile. May also be available in 93 Durometer Urethane. Please inquire for availability.

Wear Rings

APG Wear Rings are Glass Filled Nylon. The high compressive strength and load bearing capabilities of this material meet or exceed that of most metals used for wear rings. The use of these non-metallic wear rings totally eliminates metal-to-metal contact and the subsequent galling and scoring of cylinder bores and rods. These wear rings readily ingest harmful metal flakes, burrs and small chips. They will not generate contamination as is common with metallic wear rings. They are compatible with all common hydraulic oils, water emulsions, water glycol, and phosphate ester fluids. Operating temperature to 350° F. Butt cut – standard stocking configuration.

Wear Ring Piston Installation

Formula for Calculating Piston Wear Ring Grooves

- (C) Max. Groove Dia. = (A) Min. Bore - 2 (Max. Wear Ring C/S).
(C) Tolerance = + .000/- .005
- (B) Max. Piston Dia. = [(C) Min. Groove + 2 (Min. Wear Ring C/S)] - 2
(Min. Radial Clearance of .005) (B) Tolerance = + .000/- .005
- (D) Groove Length = Actual Part Ht. + .010 (D) Tolerance = + .010/- .000

Notes:

The piston diameter (B) will not correspond to diameters called out for the piston seals. Additional clearances are required for wear ring use. Be sure the entire outside diameter of the piston is no larger than (B). Be sure the piston seal compound is considered to prevent extrusion of the piston seal with the new increased diametral clearance.

Wear Ring Rod Installation

Formula For Calculating Rod Wear Ring Grooves

- (C) Min. Groove Dia. = (A) Max. Rod Dia. +2 (Max. Wear Ring C/S).
(C) Tolerance = + .003/- .000
- (B) Min. Throat Dia. = [(C - 2 (Min. Wear Ring CS)] + 2
(Min. Radial Clearance of .005). (B) Tolerance = + .003/- .000
- (D) Groove Length = Actual Part Ht. + .010 (D) Tolerance = + .010/- .000

Notes:

- Rod throat diameter (B) is a new diameter over and above the diameter which is normally called out for the rod seal. Additional diametral clearance is required as noted for the wear ring to function properly. Since a larger clearance gap results, consideration as to the rod seal compounds must be made to avoid rod seal extrusion.
- Also consider wear ring groove design for small diameter sizes. Installation problems on small sizes will occur if the groove design is not compensated.

Wear Ring Dimensional Data/Piston & Rod Installation Data

Part Number	Wear Ring Dimensions (inches)				Piston Installation Groove Data (inches)				Rod Installation Groove Data (Inches)

Wear Strips

Wear strips are designed to eliminate scoring in hydraulic and pneumatic applications by preventing metal to metal contact. They are used in reciprocating, rotary, and oscillating motion environments and are composed of PTFE and a fortified 40% Bronze material. They are supplied in continuous rolls that allow the product to be installed economically in both new assemblies and repair operations.

Wear Strips Dimensional Data

Inch Sizes		
Part Number	Width (Inches)	Thickness (Inches)
WRS39 A 0250	1/4	1/8
WRS39 A 0500	1/2	1/8
WRS39 A 0625	5/8	1/8
WRS39 A 0750	3/4	1/8
WRS39 A 1000	1	1/8
WRS39 D 0500	1/2	1/16
WRS39 D 0625	5/8	1/16
WRS39 D 1000	1	1/16
WRS39 F 0375	3/8	3/32
WRS39 F 0500	1/2	3/32

Metric Sizes		
Part Number	Width (mm)	Thickness (mm)
WRS39 - 07.9 - 2.5	7.9	2.5
WRS39 - 09.5 - 2.5	9.5	2.5
WRS39 - 10.0 - 2.0	10.0	2.0
WRS39 - 12.0 - 2.5	12.0	2.5
WRS39 - 12.7 - 2.5	12.7	2.5
WRS39 - 15.0 - 2.0	15.0	2.0

Piston Seals

Two-part seal requiring no lubrication. Piston design is simplified; and sticking, slipping, and breakaway problems are eliminated. Damage associated with cast iron or phenolic piston ring particles is eliminated as well as cylinder wall scoring. Provides bi-directional sealing. Easy installation and removal, and can be cut in the field for easier installation. Interference fit assures positive sealing. Conforms to out-of-round bore conditions. Pressures to 5000 psi. APG provides piston seals with 70 Durometer Nitrile Expanders. Other compounds are available by special order.

Square Piston Seals Style TPS1400

Square profile 15% glass filled PTFE with 70 Durometer Nitrile O-Ring (Expander)

Rectangular Piston Seals Style TPR1800

Rectangular profile 15% glass filled PTFE with 70 Durometer Square Cut Ring (Expander)

Piston Seal Installation Data

1. Clean piston in solvent and dry. Inspect groove and end of piston for nicks or burrs which could damage the expander or piston ring.
2. Lubricate expander with a compatible lubricant for easier installation.
Caution: Be sure expander is not twisted or distorted in groove.
3. Install the piston ring over a 10° included angle mandrel onto the piston body and into the groove in a single motion as quickly as possible. **Do not use pry bars, screwdrivers, knife blades, or any metal object to install piston rings - this will damage piston and seal.**
4. After installation of the piston ring, carefully guide the piston into the chamfered cylinder bore carefully (check bore first for burrs, sharp edges and foreign material). If bore is not chamfered, use a smooth, lubricated and tapered piston ring compressor to facilitate installation.
5. To remove a worn piston ring, carefully cut through the PTFE piston ring and remove. Do not cut into the expander unless it is to be replaced also. **Use care not to damage groove walls and create burrs or sharp edges.**

T-Seals

The T-Seal is compact and provides an excellent option to bulkier types of seals in a double or single acting application. It requires significantly less packing space than Vee Packings, V-Cups, or Piston Cups. The result is a compact, efficient and less costly overall component.

The T-Seal is used in reciprocating hydraulic and pneumatic equipment and in high-pressure applications. It is an excellent direct replacement for other packings (such as those in standard grooves). It fits into the same simple groove as an O-ring and eliminates rolling or spiraling, even under long stroke or dry rod conditions. It does not wedge into clearances or pinch off under motion or pressure and has good low-pressure sealing capabilities.

Because the T-Seal is supplied with a back-up on both sides of the sealing area, it functions very well in double acting applications. The back-ups are split for ease of installation.

Like other similar packings, the T-Seal is compressed to eliminate low-pressure leakage. However, the back-up rings float between the T-Seal's flanges and the rod or bore, minimizing friction and wear. When pressure is applied, a bridge is formed before extrusion can occur.

The T-Seal's back-up utilizes hydraulic pressure to keep it in contact with the rod or cylinder wall. This prevents extrusion from occurring.

The T-Seal resists spiral failure. When piston or rod movement does occur, even under very low pressures, the design allows the back-up rings to lock the sealing element in place.

APG stocks 70 Durometer Nitrile T-Seals with Nylon back-ups. Call for availability of other compounds.

Vee Packings

APG Vee Packings are multiple-lip (chevron) seals comprised of a group of endless rings and are popular for sealing rods and pistons. They can be used for low or high pressure applications and with single or double acting cylinders.

APG presently stocks Female and Male Adapters (top and bottom) in fabric reinforced Nitrile and Nylon. V-Rings (center rings) are stocked in fabric reinforced Nitrile and in homogeneous 90 Durometer Nitrile. (Call for availability of other compounds) In general, fabric Vees are for high pressure, and homogeneous Vees are for low pressure. The selection of fabric or homogeneous compounds should be made on the basis of operating pressure, temperature, and the type of gaseous or fluid medium with which the packing must function.

Female Adapter (Top)

V-Ring (Center Ring)

Male Adapter (Bottom)

Installation Data

Properly installed Vee Packings will generally outperform other lip-type seals. They are always installed in sets. Each set contains a number of V-Rings (based upon the pressure) plus male and female adapters.

The V-Rings in each set are referred to as pressure rings. Refer to the table below to determine the number of V-Rings per set based on solid rings. This table applies to the majority of installations. There will be exceptions, depending upon special operating conditions, where the table guidelines do not apply.

Recommended Number of V-Rings per Set (Based on Solid Rings)	
Pressure (PSI)	Fabric Reinforced Nitrile
Zero to 500	3
500 to 1500	4
1500 to 3000	4
3000 to 5000	5
5000 to 10,000	6
10, 000 and over	—

Standard Vee Packings use a 90° included angle (commonly referred to as 45°) measured on one side only.

Piston Cups

Piston Cups are primarily used on piston heads, plungers or rams in hydraulic or pneumatic service. Its mechanical sealing surface is at its periphery.

Piston Cups are commonly used because of economical cost, excellent service life, efficient assemble, universal acceptance, and simple accessories.

Homogeneous Piston Cups are recommended to handle low pressures (under 150 psi) in air, water, hydraulic fluids, and lubricating oils. Homogeneous Piston Cups stocked by APG are 80 Durometer Nitrile. They are also available in other homogeneous materials such as EPR, Fluoroelastomer, and Silicone.

Fabric reinforced Piston Cups prevent extrusion in medium pressure installations (up to 1000 psi) or where diametrical clearances are greater.

Piston Cup Installation Data

Figure 1 shows a Piston Cups packing (P) attached directly to a ram (R) without the use of a separate backing plate.

This is a proper method, as long as the rules of good design are observed. The cylinder should be correctly finished to close tolerances and the ram of a size and material that can be finished to leave only a minimum working clearance between it and the cylinder wall. The cylinder and ram must be of suitable material so that no scoring of the cylinder will take place.

Due to the nature of the work being done by a ram of this type, wear is inevitable and usually occurs to a great extent on one side. When this wear has progressed to a certain degree, the Piston Cup packing will not be properly supported.

To insure lip contact, Piston Cups generally are designed with the heel .010"-.015" under nominal O.D., and the lip diameter is .020"-.030" over nominal O.D. This insures heel clearance and full lip contact.

Heel clearance is needed so full pressure is not carried by this narrow area, or its wears excessively. Clearance between the piston and cylinder wall must be minimized to prevent extrusion at the cup's heel.

The seal between the bottom of the cup and the piston head is a compression seal, created by bolting or otherwise fastening the cup between the piston head (or backing plate) and follower plate. Do not over-tighten the follower nut especially when using homogenous Piston Cups. Over-tightening will cause heel to extrude cause premature failure.

Figure 1
Piston Cup
Attached to Ram

Piston Cup packings are installed with the sealing lips toward the pressure medium, thus the mechanical seal between the piston and the cylinder wall for which the cup is designed is created by the pressure applied against the cup. In the dynamic seal area indicated in Figure 2, make sure there is enough compression, with no gaps, to insure a seal. It is also important to be sure that the heel of the Piston Cup is thick enough to create compression between the areas of B and C.

Figure 2 illustrates two Piston Cup packings (A and A) which are installed back to back against a common backing plate C in a double-acting cylinder. B serves as the follower plate to compress the static seal. A good solid plate is provided which is a piston head. Packings should not be installed without a backing plate between them.

Metric Compact Piston Seals

Style ERKO

Double-acting three piece piston seal. 80 Durometer Nitrile with fabric reinforced Nitrile and Nylon guide rings. The sealing action is effected by the fabric reinforced Nitrile member at the dynamic side. Lubricants such as oil and grease are able to penetrate the fabric and allow the seal to be highly wear resistant. Can easily be to one piece pistons.

Style EZE

Double-acting three piece piston seal. 80 Durometer Nitrile with fabric reinforced Nitrile and Nylon guide rings. Consists of a solid rubber element that is reinforced with fabric on both sides. This gives the seal excellent resistance to pressure surges.

Style EZM

Double-acting five piece piston seal. 80 Durometer Nitrile with Hytrel back-up rings and Nylon guide rings. Consists of a Nitrile rubber sealing element that effects both static and dynamic sealing. The back-up rings and the guide rings are of the split type. The low profile of the guide rings provides simple installation. Not suitable for retaining applications.

Style EZW

Double-acting three piece piston seal. 80 Durometer Nitrile with fabric reinforced Nitrile and Nylon guide rings. Heavy duty seal for multi-piece pistons. The robust profile and the sturdy right angle of the back-up/support rings give the seal high resistance to peak pressures and pressure surges. Rated to 7500 psi.

Style L43

Double-acting five piece piston seal. 80 Durometer Nitrile with Hytrel back-up rings and Nylon guide rings. The hardness of the materials used in the construction of each component of the seal increases from the inside component to the outside component. As a result, the performance of each individual component is optimized in performing the individual functions of sealing, bridging the gap, and guidance within the cylinder tube.

Metric Oil Seals

Low pressure seals for rotating shafts. APG stocks Oil Seals in both Nitrile and Fluoroelastomer Compounds.

Type R

The most popular type in today's industry. Available in almost all inch and metric sizes. Meets DIN 3760-A standard.

Type RST

Rubber covered oil seal with extra dust lip to prevent contamination from penetrating the system. Very popular type of oil seal that is available in many inch and metric sizes.

Type RZV

Springless oil seal with compact cross section developed to seal needle bearings. Good grease seal. Allows very compact constructions.

Type MZV

Metal cased springless oil seal with compact cross section developed to seal needle bearings. Good grease seal. Allows very compact constructions.

Type MST

Very popular type of oil seal with a single metal case and extra dust lip to prevent contamination from penetrating the system. If desired size is not available in MST, an RST may be used in most applications.

Metric V Seals

V Seals are mounted directly on and rotate with the shaft, and the lip seals against the counterface. The body holds the lip in position and simultaneously seals against the shaft. As a result of the rotation of the V Seal, liquids, greases, oils, dirt, sand, and other solid materials are deflected from the sealing point. Therefore, the V Seal functions as both a deflector and lip seal. Since V Seals are made entirely of rubber, they are elastic and permit considerable misalignment of the shaft. This is not the case in most other shaft seals. V Seals are used with spherical rollers and plain bearings because they can absorb misalignment. V Seals are often used as a supplement with other seals to protect the shaft and the radial seal lip against dust, dirt, and other contaminants. They can also be used to supplement a stuffing box and labyrinth seals. V Seals at APG are available in both 60 Durometer Nitrile and 60 Durometer Fluoroelastomer.

Type A

Features a straight back that reduces spare requirements.

Type S

Features an inclined back.

Type L

Features a straight back with a chamfered corner.

Metric Bonded Seals

Offer extremely dependable sealing at high and low pressures with superior high and low temperature capabilities. Constructed with a metal ring that prevents excessive rubber compression and limits deformation of the elastomeric element. Also reduce bolt torque with no loss of tightening load, resulting in excellent pressure gaskets. APG Metric Bonded Seals are made of Nitrile with a metal ring.
